

## Digital supplementary material to

WONG, M.K.L. & GUÉNARD, B. 2017: Subterranean ants: summary and perspectives on field sampling methods, with notes on diversity and ecology (Hymenoptera: Formicidae). – Myrmecological News 25: 1-16.

Tab. S1: Studies sampling whole subterranean ant communities ( $n = 26$ ), first listed according to sampling technique used, followed by total species count (in descending order). The studies presented here aimed to sample whole communities of subterranean ants, that is, they did not specifically target a single group of ants. The respective techniques employed for sampling include subterranean baiting techniques such as Subterranean Baited Containers (SBC) for collecting live ants and Subterranean Pitfall Traps with preservation solution (SPT); soil sampling techniques such as the retrieval of ants from collected soil samples either manually (SSm), or with a Winkler (SSw) or Berlese extraction (SSb); the Direct Sampling (DS) of ants while excavating soil in situ. Among studies using subterranean baiting, the baits chosen for attracting subterranean ants included carbohydrates (C), lipids (L) and proteins (P). Across all studies, 12 subfamilies of ants were detected from the subterranean environment. These are: Amblyoponinae (A), Agroecomyrmecinae (Ag), Dorylinae (Dy), Dolichoderinae (D), Ectatomminae (E), Formicinae (F), Heteroponerinae (H), Leptanillinae (L), Myrmicinae (M), Ponerinae (P), Pseudomyrmecinae (Pm) and Proceratiinae (Pr). A list of corresponding references is provided at the end of the digital supplementary material.

Country (Reference)	Elevation (m a.s.l.)	Habitat	Technique (Bait)	Sampling Depth (cm)	Unit size (cm <sup>3</sup> )	Replicates	Setting time (hrs)	Total species	Subfamilies (n species)

Tab. S2: List of subterranean genus records with data on the collection location, techniques used, depth of collection within soil, and type of bait used. Subterranean sampling techniques listed here include Subterranean Baited Containers (SBC) and Subterranean Pitfall Traps (SPT); Soil Sampling coupled with manual retrieval of specimens (SSm), or a Winkler (SSw) or Berlese extraction (SSb), or Lavage de Terre (SSldt); Direct Sampling (DS) of ants while excavating soil in situ, and an additional technique – collecting subterranean ants from the gut contents of myrmecophagous lizards (LGC). Where used, baits include carbohydrates (C), lipids (L), proteins (P) and live insects (I). A list of corresponding references is provided at the end of the Appendix. NB: Names of genera presented are unaltered from the original studies, which consequently may not reflect a full taxonomic update.

Tab. S3: Studies that use subterranean sampling techniques in a standardized sampling protocol (n = 36). These are referred to in Figure 2 and Table 2 of main text, and are hereby arranged according to the nature of sampling, method and specific techniques used. Studies that conducted partial sampling aimed to collect a specific group of ants (e.g., Dorylinae), while those that conducted whole sampling collected as many species as possible without targeting a specific taxon. A list of corresponding references is provided at the end of the Appendix.

Sampling nature	Method	Specific technique	References (n = 36)
Partial	Subterranean Baiting	SBC	4, 19, 25, 26, 40, 43
Whole	Direct Sampling	DS	15, 24, 48
	Subterranean Baiting	SBC	3, 10, 16, 22, 31, 32, 33, 37, 45, 49
